Model simulations by the Intergovernmental Panel on Climate Change estimate that Earth will warm between two and six degrees Celsius over the next century, depending on how fast carbon dioxide emissions grow. Scenarios that assume that people will burn more and more fossil fuel provide the estimates in the top end of the temperature range, while scenarios that assume that greenhouse gas emissions will grow slowly give lower temperature predictions. The orange line provides an estimate of global temperatures if greenhouse gases stayed at year 2000 levels.

WHY LEARN SFD???
• Beams are commonly subjected to wall, slab and self loads which are vertical.
• Vertical loads are perpendicular to beam axis and parallel to beam cross section so they are called shear forces.
• We need to know the maximum amount of shear force on the beam and it's location so we can design the beam accordingly i.e. determine the size, orientation and material or vary the span.
[Diagram of a beam cross-section showing shear forces]

BENDING OF TWO WAY SLAB

Participants list on the right side of the screen.

TRANSFER OF LOAD ON BEAMS
ONE WAY SLAB
• The total udl calculated from slab if it is w kN/m, then udl on beam from one way slab will be
• w * slab length (lx of slab) /2
From one slab
